Contingency plan overview

The following contingency plan outlines procedures undertaken to address serious accidental spills occurring during storage, transport, or application of TFM or Bayluscide. Responsible planning to prevent, minimize, and address spills of pesticides is a multiple discipline as detailed below. Material Safety Data Sheets/ Safety Data Sheets (MSDS/SDS) for each lampricide are appended to this plan for informational purposes. The contingency plan is available at all storage sites, in all transport vehicles, and at all lampricide application points. In addition, expert resources to address pesticide spills are available from Chemtrec in the USA (requires account number) or from Canutec in Canada.

Training program

This contingency plan is a component of training sessions for personnel who apply or transport the lampricides. Familiarization with the various scenarios described in this plan and the implementation of prompt, responsive action in each situation is stressed. The plan is reviewed and updated as necessary. Copies of the contingency plan, spill clean-up equipment, and protective gear are included in transport vehicles and at lampricide application sites.

Packaging

TFM is a liquid formulation packaged in heavy-duty, approximately 5-gal plastic containers that weigh about 50 pounds. This container size limits potential spills by eliminating bulk storage containers.

TFM bars are packaged individually in resealable plastic containers. The containers are shipped in cardboard boxes.

Bayluscide 3.2% Granular Sea Lamprey Larvicide is packaged in 5-gal plastic buckets. Each bucket with product weighs 50 lbs. The type of packaging, moderate container size, stacking restrictions, and use of pallets minimize the likelihood of a significant spill during storage, transport, or handling.

Bayluscide 70% Wettable Powder is packaged in 0.5- and 3-lb containers. The containers are shipped from the manufacturer in plastic lined, heavy-duty boxes. The containers are not removed from the shipping boxes until time of use.

Bayluscide 20% Emulsifiable Concentrate is packaged in 1- or 5-L plastic bottles. Bottles are shipped and stored in cardboard boxes.

Storage

Lampricide stockpiles are secured under lock. Local fire departments are alerted of the presence of lampricides and of special firefighting procedures recommended for these chemicals (see MSDS/SDS; appendix F). Building construction and placarding follow state guidelines. A spill and emergency response plan is in place for the lampricide storage facilities in Ludington and Marquette and are available in the station safety plans.

Transport

Enclosed trucks and lockable trailers are used to transport lampricides to application points. In the U.S. the transport of formulations of Bayluscide and TFM is regulated by the Department of Transportation; transportation of amounts of pesticides over regulated quantities requires additional certification and training to acquire the required CDL license. Each driver carries a copy of this contingency plan and has access to safety equipment and spill containment and clean-up kits. In Canada transport of lampricides follows Transport of Dangerous Goods guidelines (Transport of Dangerous Goods Regulations, 1992). If lampricide is lost during transport the following steps are followed:

1. Assess the situation
2. Document the route traveled
3. Contact supervisors and authorities
 - a. Treatment Supervisor
 - b. Station Supervisor
 - c. Field Supervisor
 - d. Local Authorities
 - e. State or provincial authorities

4. Notify previous list if lampricide is recovered
5. If lampricide was spilled when lost, follow procedures in “Spills on land” or “Spills into water”.

Application

Lampricide treatments on streams are conducted by certified pesticide applicators. Lampricide application and monitoring procedures ensure that the concentration of lampricide remains within a restrictive yet effective range. Lampricide containers are opened only as needed at streamside application points. Precautions are taken to ensure that only required quantities of TFM are transported to, and stored at individual application points.

Empty TFM containers are triple-rinsed or equivalent at treatment sites, rendered useless by crushing or puncturing, and disposed of in an approved municipal landfill or offered for recycling. Empty Bayluscide containers are disposed of in accordance with label directions. Lampricide dispensing equipment is thoroughly rinsed at treatment or survey sites.

Spills on land

In the event of a major lampricide spill (exceeding reportable amount) during storage or transport or at an application site it is a priority that the spill is stopped at its source, the spilled material is contained, and the proper authorities are notified. Shovels and other hand tools are used for immediate containment or channelization of spilled lampricide into a containment area. Spills of Bayluscide granular and wettable powder on land are readily controlled by sweeping and shoveling by personnel protected from dust inhalation. The following actions are taken as necessary to contain and clean up a major spill on the ground:

1. Use safety equipment
2. Stop the spill at its source
3. Dike TFM and Bayluscide 20% Emulsifiable Concentrate liquid formulations in pools as appropriate
4. Contain dry Bayluscide or TFM in piles
5. Dike any solution of Bayluscide
6. Absorb TFM and Bayluscide 20% Emulsifiable Concentrate liquid formulations with clay, soil, or other noncombustible, absorbent materials
7. Absorb dry or solubilized Bayluscide with sand, clay, soil, or other noncombustible material
8. Report the spill to the Treatment Supervisor and to proper authorities
9. Transport clean up materials resulting from a lampricide spill via licensed hauler to a permitted hazardous waste treatment, storage, or disposal facility

Spills into water

During highway transport there is the possibility of a vehicle accident over or near a waterway. In such an occurrence containment action is initiated to prevent or minimize movement into a waterway. If a major lampricide spill occurs into a stream not scheduled for immediate lampricide treatment, the following emergency actions are initiated:

1. Immediately notify and consult with State/County Public Health Office (see emergency telephone numbers)
2. Issue an emergency advisory on water use restrictions at and downstream of the spill location through local radio and door-to-door contacts. The emergency advisory prohibits water use for drinking, cooking, other household uses, swimming and fishing until further notification.
3. Initiate lampricide monitoring to follow and determine the concentration of the chemical block.

Accidental spills of lampricide into a stream during treatment operations could occur only when lampricide monitoring activities are already underway. In such an instance, monitoring activities are extended. Automatic water samplers are set at the intake of any municipal water supply system that may be contaminated as the result of a major spill of lampricide into a waterway.

Reporting of Spills

In the United States, spills of pesticides are reported to individual states, as detailed at the end of this Appendix. For example, in Michigan, an accidental spill of 1 or more containers must be reported to the Pollution Emergency Alerting System (PEAS) and the Michigan Department of Environmental Quality. The State Police are called if no PEAS or equivalent system phone number is listed for the state in which the spill occurs. The state of Michigan requires that spills of the following magnitude be reported: TFM, one container (approximately 5 gals); Bayluscide 3.2% Sea Lamprey Larvicide, one container (50 lbs); Bayluscide 70% Wettable Powder, one plastic container (0.5 lb); and Bayluscide 20% Emulsifiable Concentrate, 1 bottle (5L). Spill amounts of equal magnitude will be reported in other States. If any uncontrolled release (any amount not dispensed by a pump) of TFM or Bayluscide occurs, a treatment supervisor must be immediately notified.

In Canada, spills of the following magnitude must be reported immediately to local police, OMOE and Canutec: TFM, 5 L or greater; Bayluscide 3.2% Granular Sea Lamprey Larvicide, 5 kg or greater; Bayluscide 70% Wettable Powder, 5 kg or greater; and Bayluscide 20% Emulsifiable Concentrate, 5 L or greater. The content of the immediate report must include:

- a) Shipping name of product or UN number
- b) Quantity of dangerous goods in the shipment and quantity released
- c) Location of the accidental release
- d) Number of injuries and/or deaths
- e) Estimate of the number of people evacuated

If an immediate report is made, the employer of the person who made the immediate report must send a written follow-up report within 30 days to the Transport of Dangerous Goods General containing the following information:

- a) Name, address, and telephone number of the place of business
- b) Date, time, and location of the accidental release
- c) Name and address of consignor
- d) Classification of the dangerous goods
- e) Quantity of dangerous goods in the shipment and an estimate of the amount that was released
- f) Description of the means of containment involved and if the container failed or was damaged and how it happened
- g) In case of an accidental release from a cylinder that suffered a catastrophic failure, the certification safety mark and a description of the failure
- h) Number of deaths and injuries
- i) Estimate of the number of people evacuated
- j) Whether an Emergency Response Action Plan was activated, and the name of the person who responded

Note: Restricted use pesticide labels and MSDS/SDS are contained in Appendices E and F respectively.
